## Methods

### *Data Reduction*

After QA/QC checks for pump failures, dropped/torn filters, etc., there were 573 valid I/O sulfur pairs. To minimize the influence of indoor sulfur sources, we excluded 22 observations where the participant reported that smoking had occurred in the home during the 2-week period, and 6 cold season observations from homes with kerosene heaters (Koutrakis et al. 1992). We also removed 11 observations where the I/O sulfur ratio was greater than 1.05, which indicated an indoor sulfur source. We included ratios between 1.00 and 1.05 to account for imprecision in the sulfur measurements. We also excluded 6 observations where the participants reported that the home was “smoky from cooking” for  $\geq 10$  hours during the 2-week sampling period, since window opening and other behaviors during such periods may not represent typical conditions. To minimize the influence of extreme values on the  $F_{\text{inf}}$  models, we also removed one distant outlier ( $F_{\text{inf}}$  more than 3 interquartile ranges below the community- and season-specific 25<sup>th</sup> percentile) in Los Angeles and New York. These exclusions left 526 I/O sulfur pairs (from 353 homes) for analysis.

### *Calculation of Contributions to Indoor Concentrations*

For each valid  $F_{\text{inf}}$  observation, we estimated the infiltrated ( $PM_{2.5}^{\text{inf}}$ ) and indoor-generated ( $PM_{2.5}^{\text{ig}}$ ) contributions to the 2-week average indoor  $PM_{2.5}$  concentrations based on the measured  $PM_{2.5}$  concentrations outdoors ( $PM_{2.5}^{\text{outdoor}}$ ) and indoors ( $PM_{2.5}^{\text{indoor}}$ ) and the home-specific estimate of  $F_{\text{inf}}$  (Allen et al. 2004):

$$PM_{2.5}^{\text{inf}} = F_{\text{inf}} \times PM_{2.5}^{\text{outdoor}} \quad (1)$$

and

$$PM_{2.5}^{\text{ig}} = PM_{2.5}^{\text{indoor}} - PM_{2.5}^{\text{inf}} \quad (2)$$

When  $PM_{2.5}^{inf} > PM_{2.5}^{indoor}$ , we set  $PM_{2.5}^{inf} = PM_{2.5}^{indoor}$  and  $PM_{2.5}^{ig} = 0$ .

### ***Model Development***

We developed models using two approaches. In the first approach we 1) calculated the correlations between each predictor and  $F_{inf}$ , 2) offered the significantly ( $p < 0.1$ ) correlated predictors into a stepwise linear regression ( $p < 0.30$  to enter;  $p < 0.10$  to remain) with  $F_{inf}$  as the dependent variable, and 3) removed predictors that contributed less than 0.01 to the model  $R^2$ . In the second approach, we 1) calculated the correlations between each predictor and  $F_{inf}$ , 2) entered the highest-correlated predictor into a model with  $F_{inf}$  as the dependent variable, 3) calculated the model residuals, 4) calculated the correlations between the model residuals and all remaining predictors, 5) added the highest-correlated predictor as an additional predictor in the model with  $F_{inf}$  as the dependent variable, and 6) repeated steps 3-5 until the model included all variables with  $p < 0.10$  that contributed at least 0.01 to the model  $R^2$ . Under both methods, we only included predictors for which the coefficient's sign was consistent with physical processes (e.g., positive coefficients for window opening). Since the models were developed to predict  $F_{inf}$ , we did not account for possible dependence between measurements made in the same home or in the same community. In the preliminary community-specific models we required that every variable have at least 4 non-zero observations to be included in the model.

Based on responses provided on the MESA Air Questionnaire at study entry. Questions were worded as follows:

<sup>a</sup> “What type of building do you live in?” = Single-family or free-standing.

<sup>b</sup> “What type of air conditioning does your residence have?” = Central AC + “How often was the air conditioning used in the past July?” ≥ A few days a month

<sup>c</sup> “How many windows did you usually have open in the past summer?” = All or Some

<sup>d</sup> “What type of air cleaner/filter is used in your residence?” = HEPA filter and/or electrostatic precipitator

<sup>e</sup> “Did anyone smoke in your residence in the past 12 months (this includes you)?” = Yes

**Supplemental Material Table 2. Mean ( $\pm$  SD) 2-week PM<sub>2.5</sub> concentrations and estimated indoor and outdoor contributions to indoor PM<sub>2.5</sub> concentrations by community and season.**

<sup>a</sup> Cold and warm seasons defined as  $\leq 18^\circ\text{C}$  and  $> 18^\circ\text{C}$ , respectively, during the 2-week I/O sampling period

<sup>b</sup> Some homes were monitored twice in the same season.

**Supplemental Material Table 3. Main MESA Air Questionnaire questions used to derive predictors in the generalizable and 2-week specific infiltration efficiency models.**

<b>Predictor</b>	<b>Questions</b>	<b>Response(s)<sup>a</sup></b>
<b>Central AC used a few days in the past July</b>	Do you use air conditioning in your residence?	Yes
	What type of air conditioning does your residence have?	Central A/C
	How often was the air conditioning used in the past July?	A few days a month
<b>Central AC used &gt; ½ time in the past July</b>	Do you use air conditioning in your residence?	Yes
	What type of air conditioning does your residence have?	Central A/C
	How often was the air conditioning used in the past July?	More than half the days of the month, but less than daily OR Almost daily (thermostat use also)
<b>Central AC used at all in the past July</b>	Do you use air conditioning in your residence?	Yes
	What type of air conditioning does your residence have?	Central A/C
	How often was the air conditioning used in the past July?	A few days a month OR More than half the days of the month, but less than daily OR Almost daily (thermostat use also)
<b>Home has forced air heat</b>	What are the heating sources used in your residence? Please check all that are used at least once a month.	Forced air (vents)
<b>Home has double pane windows</b>	Does your residence have double pane windows?	Yes
<b>Windows open ≥ ½ time in the past summer</b>	In summer (Jun – Aug) how many windows did you usually have open?	All OR Some
	In summer (Jun – Aug) how often did you open windows?	More than half the days of the month, but less than daily OR Almost daily
<b>Windows open ≥ ½ time in the past winter</b>	In winter (Dec – Feb) how many windows did you usually have open?	All OR Some
	In winter (Dec – Feb) how often did you open windows?	More than half the days of the month, but less than daily OR Almost daily

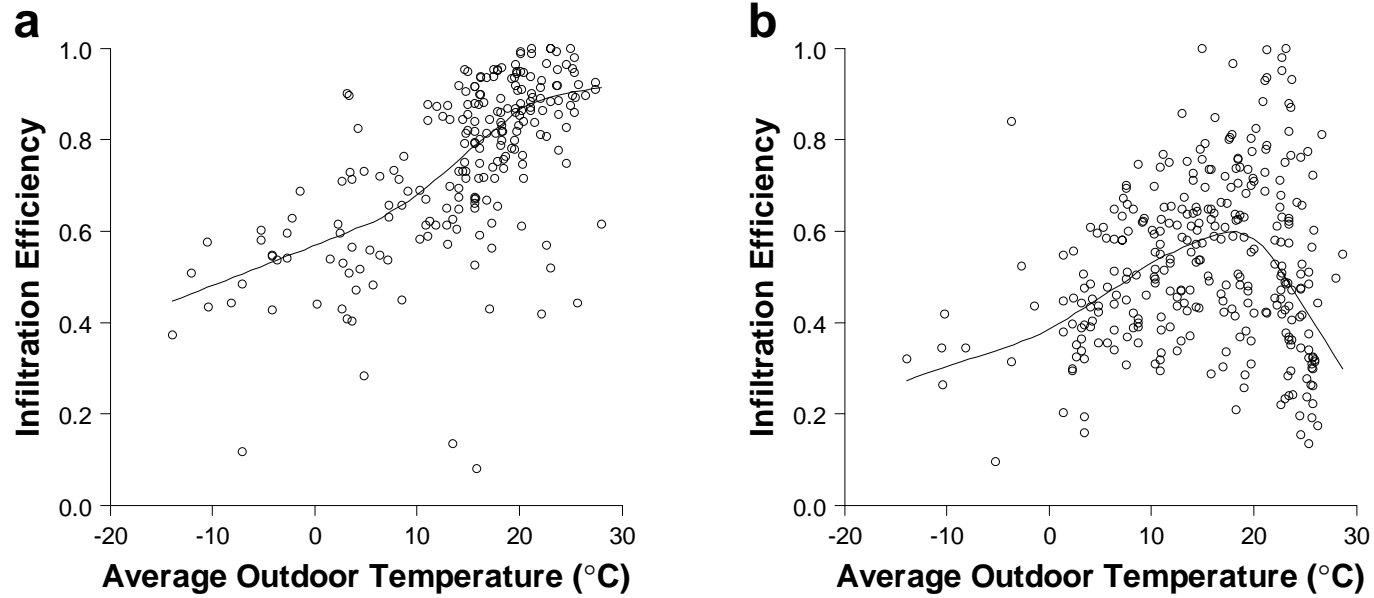

<sup>a</sup>Homes with these responses were coded as 1; homes with other responses were all coded as 0.

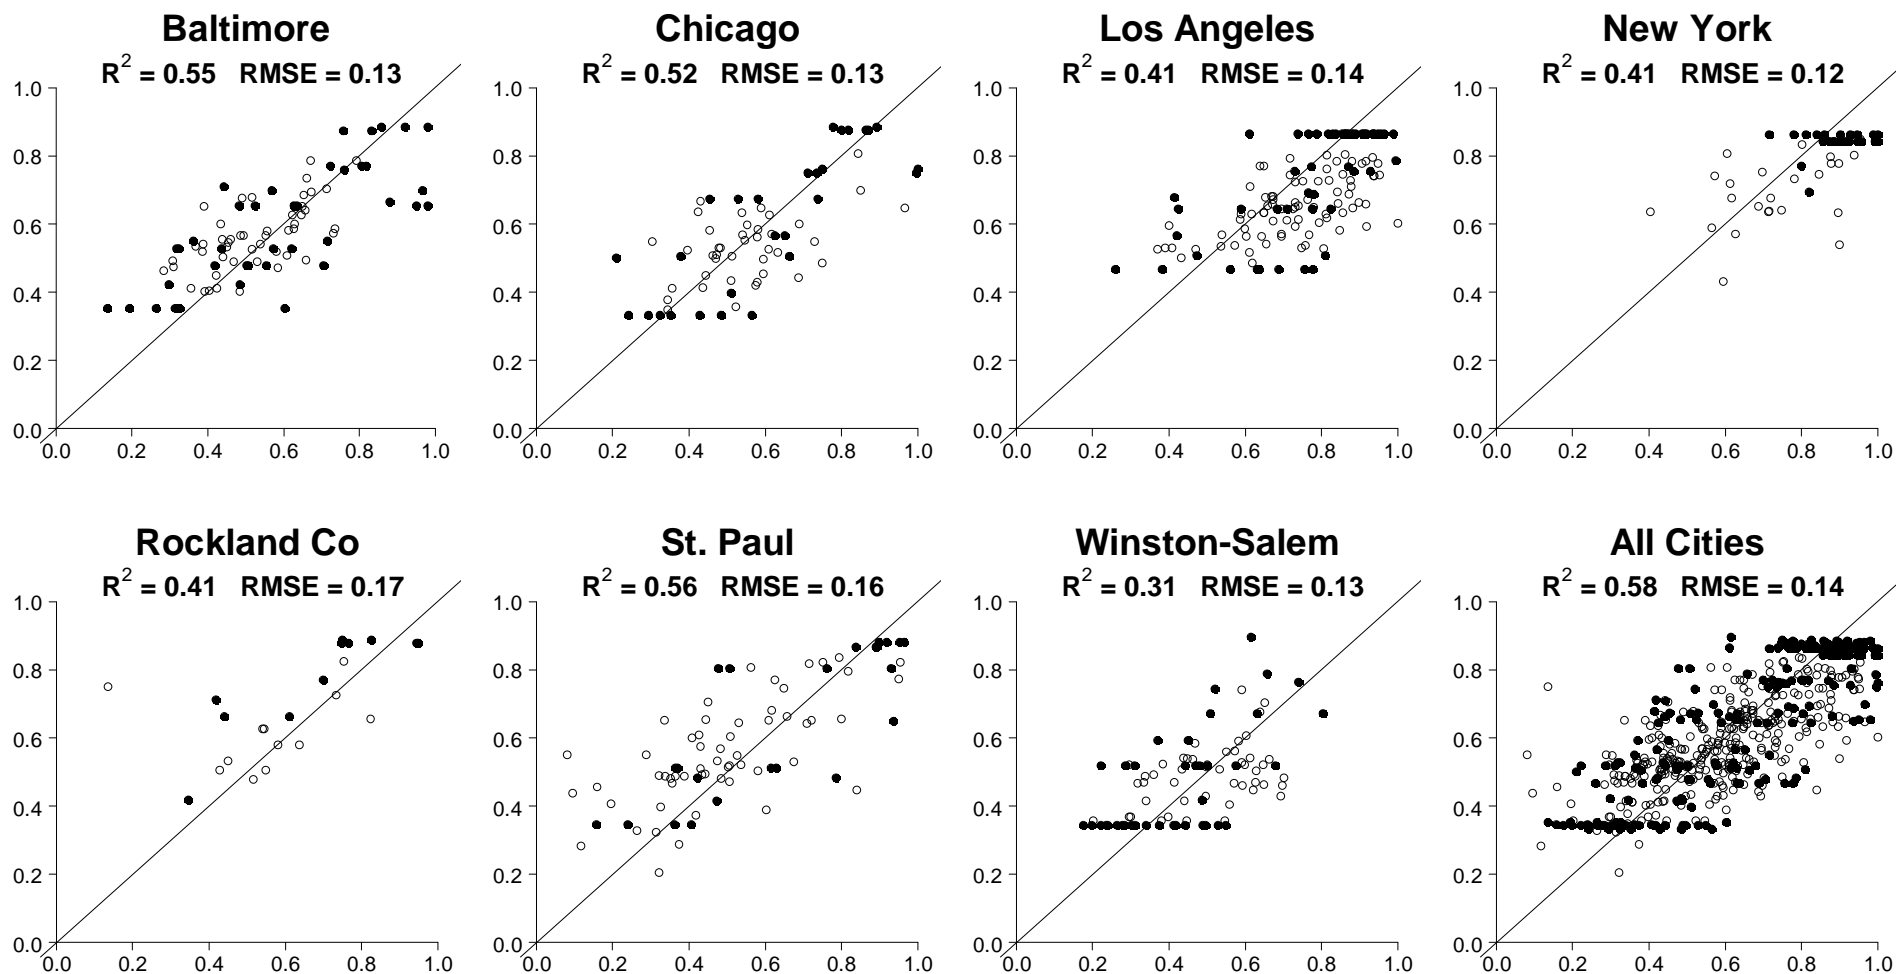

**Supplemental Material Table 4. Infiltration Questionnaire questions used to derive predictors in the 2-week specific infiltration efficiency models.**

<b>Predictor</b>	<b>Questions</b>	<b>Response(s)<sup>a</sup></b>
<b>Central AC used <math>\geq</math> 6 days during sampling</b>	Does your home have air conditioning?	Yes
	What type of air conditioning does your residence have?	Central A/C
	How often did you use air conditioning in the past 12-14 days?	6 – 10 days OR 11-14 days
<b>Central AC used <math>\geq</math> 11 days during sampling</b>	Does your home have air conditioning?	Yes
	What type of air conditioning does your residence have?	Central A/C
	How often did you use air conditioning in the past 12-14 days?	11-14 days
<b>HEPA or ESP used <math>\geq</math> 11 days during sampling</b>	During the past 12-14 days, was an air cleaner/filter (stand-alone or central) used in your home?	Yes
	What kind of air cleaner did you use?	HEPA filter OR Electrostatic precipitator
	How often was the air cleaner/filter used in the past 12-14 days?	11-14 days
<b>Windows open 6-10 days during sampling</b>	During the past 12-14 days, how often did you have windows open?	6-10 days
<b>Windows open <math>\geq</math> 11 days during sampling</b>	During the past 12-14 days, how often did you have windows open?	11-14 days

<sup>a</sup>Homes with these responses were coded as 1; homes with other responses were all coded as 0.

**Supplemental Material Figure 1. Infiltration efficiency vs. average outdoor temperature during the 2-week sampling period among a) homes not using air conditioning and b) homes using air conditioning.**

**Supplemental Material Figure 2.** Comparisons of measured infiltration efficiencies (x-axes) with values predicted from a leave-one-community out cross validation (y-axes) for the generalizable models shown in Table 2. White and black circles represent cold and warm seasons, respectively; lines represent 1:1.
